

**Naked Science: "Birth of the Universe" Video Worksheet** - Fill in the blanks as you watch the video. BEWARE – some of these answers will go by quickly! Work in groups of 2-3 to get them all.

- Everything we see around us is made of \_\_\_\_\_ 1 \_\_\_\_\_; \_\_\_\_\_ 2 \_\_\_\_\_, and \_\_\_\_\_ 3 \_\_\_\_\_.
- Each and every atom that makes up the car were \_\_\_\_\_ 4 \_\_\_\_\_ by our growing \_\_\_\_\_ 5 \_\_\_\_\_.
- Physicist Lawrence Krauss: "We really are part star dust and part Big Bang dust. Most of the atoms in our body are from the \_\_\_\_\_ 6 \_\_\_\_\_ of \_\_\_\_\_ 7 \_\_\_\_\_, but some of them have been around since the earliest moments of the \_\_\_\_\_ 8 \_\_\_\_\_."
- Each and every atom was created over \_\_\_\_\_ 9 \_\_\_\_\_ of years as our universe evolved.
- In the beginning, there was \_\_\_\_\_ 10 \_\_\_\_\_.
- According to Krauss, everything that now exists in our universe was once contained in a region smaller than a \_\_\_\_\_ 11 \_\_\_\_\_.
- The idea that our universe was once tiny originated with American astronomer \_\_\_\_\_ 12 \_\_\_\_\_.
- In the 1920s, most astronomers believed that everything visible in the night sky were \_\_\_\_\_ 13 \_\_\_\_\_ that were all part of our own \_\_\_\_\_ 14 \_\_\_\_\_, the Milky Way.
- Hubble showed that other galaxies were speeding \_\_\_\_\_ 15 \_\_\_\_\_ from ours, and the further they were, the \_\_\_\_\_ 16 \_\_\_\_\_ they seemed to be moving.
- The universe was \_\_\_\_\_ 17 \_\_\_\_\_; and if the universe was expanding, then at some point in the past, it must have been \_\_\_\_\_ 18 \_\_\_\_\_.
- Physicist David Spergel: "The Big Bang theory is not really a theory about how the universe began; it's really a theory of how the universe \_\_\_\_\_ 19 \_\_\_\_\_."
- When the universe was a billionth of a billionth of a billionth of a billionth of a minute old, it was about

the size of a \_\_\_\_\_ 20 \_\_\_\_\_.

- As the universe expanded, it \_\_\_\_\_ 21 \_\_\_\_\_.
- A trillionth of a second after the big bang, our newborn universe was still expanding. But it didn't contain matter – it was pure \_\_\_\_\_ 22 \_\_\_\_\_.
- In the baby universe, pure energy was converted into particles of \_\_\_\_\_ 23 \_\_\_\_\_.
- The universe is now one millionth of a second old, and has expanded to \_\_\_\_\_ 24 \_\_\_\_\_ times the size of the solar system. The universe was now relatively \_\_\_\_\_ 25 \_\_\_\_\_.
- Over the next three minutes, the universe cools enough for protons and neutrons to bind together and form the first atomic nuclei: \_\_\_\_\_ 26 \_\_\_\_\_ and \_\_\_\_\_ 27 \_\_\_\_\_. But they were not yet proper atoms – they were missing a vital ingredient – the \_\_\_\_\_ 28 \_\_\_\_\_, which were moving too fast to form bonds with the nuclei.
- 380,000 years after the Big Bang, the universe had expanded to the size of the \_\_\_\_\_ 29 \_\_\_\_\_. It had cooled from billions of degrees Fahrenheit to a few \_\_\_\_\_ 30 \_\_\_\_\_. As it cooled, the electrons slowed down, and the universe was now ready to make its first true \_\_\_\_\_ 31 \_\_\_\_\_.
- Over the next millions of years, the young universe continued to expand and cool. So far, the universe had only made \_\_\_\_\_ 32 \_\_\_\_\_ and \_\_\_\_\_ 33 \_\_\_\_\_ atoms. But the world we live in is made from more than \_\_\_\_\_ 34 \_\_\_\_\_ different kinds of elements. The universe needed to get hydrogen and helium atoms to \_\_\_\_\_ 35 \_\_\_\_\_. And to do that, it needed to make \_\_\_\_\_ 36 \_\_\_\_\_.
- Tiny imperfections in the fledgling universe would become \_\_\_\_\_ 37 \_\_\_\_\_ and \_\_\_\_\_ 38 \_\_\_\_\_.
- Over millions of years, hydrogen atoms clumped together and \_\_\_\_\_ 39 \_\_\_\_\_. The atoms began fusing and releasing \_\_\_\_\_ 40 \_\_\_\_\_. The gas clouds started to burn brightly. Eventually, a \_\_\_\_\_ 41 \_\_\_\_\_ was born.

- Early stars acted like giant thermonuclear reactors, creating new \_\_\_\_\_42\_\_\_\_\_.
- Fusion reactions inside these stars released enormous amounts of energy and heat, which forced atoms to fuse to form new, heavier elements. Three helium nuclei combine to form \_\_\_\_\_43\_\_\_\_\_; two carbon nuclei fuse to form \_\_\_\_\_44\_\_\_\_\_; magnesium to form \_\_\_\_\_45\_\_\_\_\_; and so on over a period of hundreds of thousands of years, until silicon fused to form \_\_\_\_\_46\_\_\_\_\_.
- Iron is a very special atom. Even the extreme temperature inside stars cannot get iron to \_\_\_47\_\_\_ into heavier elements.
- To create the heavier elements like chromium and zinc and gold and platinum, the universe conjured up massive exploding stars called \_\_\_\_\_48\_\_\_\_\_.
- When the giant stars that made the lighter elements ran out of \_\_\_\_\_49\_\_\_\_\_, they collapsed in on themselves, creating incredible amounts of energy and enormous explosions. Supernova explosions were so powerful, they could fuse elements even heavier than iron, and \_\_\_\_\_50\_\_\_\_\_ the element production line.
- Without exploding stars, life itself \_\_\_\_\_51\_\_\_\_\_.
- Everything we can see on our planet was either made in the \_\_\_\_\_52\_\_\_\_\_ or inside a \_\_\_\_\_53\_\_\_\_\_.
- The universe we live in is nearly \_\_\_\_\_54\_\_\_\_\_ years old.
- One theory of the end of the universe suggests that our universe will “run out of steam” and start to \_\_\_\_\_55\_\_\_\_\_, ending in a single super-dense pinpoint known as the \_\_\_\_\_56\_\_\_\_\_.
- However, analysis of Type 1A supernovae suggests that the universe is actually \_\_\_\_\_57\_\_\_\_\_ in its expansion, meaning that the universe will not collapse.

- Quite the opposite, it will continue to expand faster and faster. Our universe is literally \_\_\_\_58\_\_\_\_  
\_\_\_\_59\_\_\_\_.
- The most likely future is perhaps the most dismal one, where the universe becomes \_\_\_\_60\_\_\_\_ and  
\_\_\_\_61\_\_\_\_  
and \_\_\_\_62\_\_\_\_. Space will become \_\_\_\_63\_\_\_\_ and \_\_\_\_64\_\_\_\_.
